

Pre-natal and Pediatric Chiropractic Care

POST DOCTORAL STUDIES IN PRENATAL AND PEDIATRIC CHIROPRACTIC

- Adjustments are gentle. Very little force is needed or used. Many babies sleep right through their adjustments.

- Pelvic misalignment may cause restrictions that interfere with the onset of labor. Restoring proper pelvic position allows the normal process of birth to begin.

- We see babies in our office from newborn on. Some come for "wellness". The nervous system controls every function of the body, so it is important in all aspects of a person's health...right from birth!

- The upper cervical region (the top of the neck) is a particularly important region of the vertebral column. Many important functions such as breathing, heart rate, and temperature are controlled by the nervous system at this level.

- Some babies come for the correction of injuries sustained in a trauma (such as falling off a bed or changing table).

- Pregnant women and babies make up 80-90% of our practice!

Consultations
are always
FREE of charge.
